- All fonts include the full CP437[ $\rightarrow$ ] (DOS/US) character range; fonts labeled "+Plus" have extended Unicode versions, too.
- Most of these fonts were made for CRT or LCD monitors that didn't necessarily have square pixels, unlike current displays. Alongside the simple square-pixel versions, these fonts have aspectcorrected variants to reproduce the original appearance.
- For fonts that *were* originally used in square-pixel resolutions (or close enough that the difference is negligible), no aspect-corrected variants are provided.

## I. FONTS FROM THE IBM PC AND FAMILY

These are the original character sets provided with the IBM PC line (PC, XT, PCjr, AT, PS/2, etc.) in hardware or firmware, and with official add-on products from IBM, such as graphics adapters and certain versions of DOS. Naturally, they were also duplicated by a huge number of 3rd-party hardware manufacturers.

## IBM PC SYSTEM BIOS

With pre-EGA video, the system BIOS provides the default $8 \times 8$ font for graphics mode (the firmware contains only the lower 128 ASCII characters; the upper half has to be loaded separately). For EGA and up, IBM included the full version in the on-board video ROM, for text *and* graphics modes that require an $8 x 8$ font.

The wide ' $2 x$ ' version is seen e.g. in $160 \times 200$ (PCjr) or $320 x 400$ (VGA). The ' $2 y^{\prime}$ version is what you get in $640 \times 200$ modes.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { IBM BIOS } \\ & \text { 8x8; CP437, +Plus } \end{aligned}$ | Square 1:1 | I BH BI乐 |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 6 \end{aligned}$ |  |
| $\begin{aligned} & \text { IBM BIOS-2x } \\ & 8 \times 8 ; \text { CP437, +Plus } \end{aligned}$ | Square $2: 1$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 3 \end{aligned}$ |  |
| $\begin{aligned} & \text { IBM BIOS-2y } \\ & 8 \times 8 ; \text { CP437, +Plus } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 2 \end{aligned}$ | IBN BIOS-2y $\quad$ AabbccDd 0123456789 |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 12 \end{aligned}$ | IBN BIOS-2y |

IBM's first two video solutions shared the same character ROM, which provided the text mode font: neither CGA nor MDA could redefine it. Cards for the US market contained the CP437 character set; the non-US characters in the 'Plus' fonts were adapted from localized ROMs off cards sold internationally (most of the Greek, Cyrillic and Hebrew blocks), plus manual additions.

For CGA, the ROM contains two different $8 x 8$ fonts usable in text mode. The default 'thick' variant differs from the BIOS font in only four characters (s, $\boldsymbol{\wedge}$, S) ; PCjr text modes use this font too. The alternate 'thin' one is selectable in CGA only and requires hardware modification. I've included 1:1 (40-column) and half-width ( $80-\mathrm{column}$ ) versions for both of these.

| Font/Charsets: | Aspect: | Sample text: |

|  | $\begin{aligned} & \text { Correct } \\ & 5: 12 \end{aligned}$ | IBM CGAthin-2y 1 ABBbCDd 0123456789 |

## MDA (MONOCHROME DISPLAY/PRINTER ADAPTER):

The same ROM includes the 14 -scanline font used by the MDA for its single mode - 80-column text. Its characters are stored as 8 pixels wide, but displayed with an additional 9 th column: blank for most glyphs, but for box/block-drawing chars it duplicates the 8th. The same font was used on the Hercules Graphics Card and a host of other clones.

IBM SECOND-GENERATION VIDEO - EGA/MCGA/VGA

These adapters introduced fully programmable character sets, so DOS could now redefine them for international scripts - the multilingual 'Plus' versions here are based on various DOS code pages. 80column text was evidently the main focus by this point: at 40 columns, the funny pixel aspect ratio makes the default font even *less* readable than CGA.

EGA (AND LATER):

The EGA's text modes (and $640 \times 350$ graphics mode) use the new $\mathbf{8 x 1 4}$ font by default. The $\mathbf{8 x 8}$ font is identical to the PC BIOS one, but it gets its own version, since the narrower aspect ratio in 350line modes is specific to EGA:

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| IBM EGA $8 \times 14$ <br> 8x14; CP437, +Plus | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | IBM EGA Bx14 © AaBbCcDd E123456789 |
|  | Correct $3: 4$ | IBM EGA 8x14 - AaBbCcDd 0123456789 |

| IBM EGA 8x14-2x <br> 8x14; CP437, +Plus | Square $2: 1$ |  |
| :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 2 \end{aligned}$ | IBM EGA Bri4-2x $\quad$ AaBbCoDd 日1234567 |
| $\begin{aligned} & \text { IBM EGA 8x8 } \\ & 8 \times 8 ; \text { CP437, +Plus } \end{aligned}$ | Square $1: 1$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 4 \end{aligned}$ | IBH EGA Br8 A ABbGoDd 4123456789 |
| $\begin{aligned} & \text { IBM EGA 8x8-2x } \\ & 8 \times 8 ; \text { CP437, +Plus } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 2: 1 \end{aligned}$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 2 \end{aligned}$ |  |

When the EGA is used with a monochrome monitor, character cells receive a bonus 9th column just like on MDA/Hercules. The 14 -line font even sports wider variants of some glyphs for this purpose.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |

|  | $\begin{aligned} & \text { Correct } \\ & 4: 3 \end{aligned}$ |  |

VGA/MCGA (AND LATER):

The PS/2 standards further modified the system font, with a character cell 16 pixels tall and a few stylistic changes ('0', '0' etc.).

With VGA, 9-dot character cells were now the default, and the resulting $9 \times 16$ glyphs make up the famous font which remains most strongly associated with ASCII art on the PC, and probably with the entire DOS era in general. The EGA sizes were also available, but with different aspect ratios due to the extra vertical resolution.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { IBM VGA } 9 \times 16 \\ & 9 \times 16 ; \text { CP437, +Plus } \end{aligned}$ | $\underset{1}{\text { Square }}$ | IBM UGA 9x16■ AaBbCcDd 0123456789 |

| :---: | :---: | :---: |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 4 \end{aligned}$ | IBM UGA 9x14 AaBbCcDd 0123456789 |
| $\begin{aligned} & \text { IBM VGA 9x14-2x } \\ & 9 \times 14 ; \text { CP437, +Plus } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 2: 1 \end{aligned}$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 2 \end{aligned}$ |  |
| $\begin{aligned} & \text { IBM VGA 9x8 } \\ & \text { 9x8; CP437, +Plus } \end{aligned}$ | Square 1:1 |  |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 4 \end{aligned}$ |  |
| $\begin{aligned} & \text { IBM VGA 9x8-2x } \\ & 9 \times 8 ; \text { CP437, +Plus } \end{aligned}$ | Square 2:1 | I \# \#- |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 2 \end{aligned}$ |  |

Plain old 8-dot characters were still available, both on VGA and on its lobotomized low-end cousin, MCGA (where they were the only option). The $8 x 8$ size here was exactly the same as the PC BIOS font once again, so no sense in adding yet another version of it.

## OTHER IBM HARDWARE

3270 PC (IBM 5271):

This one has some rather exotic video hardware[ $\rightarrow$ ], but also offers a basic $80 x 25$ text mode with a distinct, (mostly) sans-serif $9 \times 14$ font. Unlike most PC hardware fonts, the 9 th column is stored in the actual bitmap data.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |

|  | Correct $2: 3$ | IBM 3270pc • AaBbCcDd 0123456789 |

PGC (PROFESSIONAL GRAPHICS CONTROLLER):
IBM's first high-end PC graphics card has a 400-line text mode with an $8 \times 16$ character cell. It basically takes the $8 \times 14$ EGA font and adds two scanlines, which most characters simply use as extra padding.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { IBM PGC } \\ & 8 \times 16 ; ~ C P 437 \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | IBH PGC $\quad$ AaBbCcDd 0123456789 |

|  | $\begin{aligned} & \text { Correct } \\ & 5: 3 \end{aligned}$ | IBM PGC-Zx - AaBbCcid 0123456789 |

PC CONVERTIBLE (IBM 5140):
Mostly based on CGA, the Convertible adds support for redefinable $8 \times 8$ charsets. The default is a rather elaborate serif font, which IBM also used as a basis for PC-DOS 3.20's LCD-specific codepages.
The squat, built-in monochrome LCD had square pixels at $640 \times 200$ (that's 16:5 - how's that for you widescreen fanatics?), but the optional external monitor was a regular $4: 3$ CRT, so the aspectcorrected versions are based on that.

| Font/Charsets: | Aspect: | Sample text: |

|  | $\begin{aligned} & \text { Correct } \\ & 5: 12 \end{aligned}$ | IBH Comv-2y |

PS/2 MODEL 30 (EARLY REVISION):
In the earliest variant of the PS/2 Model 30 (the 'rev. 0' BIOS dated 09/02/86), the built-in $8 \times 16$ font is slightly different from the MCGA/VGA font of the later units: "0", "0", " $\beta$ ", and characters with descenders and umlauts are closer to their EGA forms. The Model 30 is MCGA-only, so there is no 9 -dot-wide version.

| Font/Charsets: | Aspect: | Sample text: |

## PS/2 16-BIT ISA MODELS (ALTERNATE FONTS):

PS/2 models based on the 16-bit ISA bus (at least the 25-286, 30-286, 25 SX, 35 SX) include additional fonts in ROM, alongside the usual VGA fonts. These are all rather nondescript, and I'm not aware of any software that ever actually used them; they're not documented and the video BIOS code doesn't seem to reference them, so such software is unlikely to exist.

| Font/Charsets: | Aspect: | Sample text: |

PS/55:
The PS/2's Japanese cousin $[\rightarrow]$ had generously large bitmap fonts to support that language's various scripts. Since full CJK fonts are outside the scope of this collection, the version here is a CUSTOM REMAPPING to CP437 (with supplements).

Internally the bitmaps are $12 \times 24$ dots. Later, they were replicated in IBM DOS/V for generic PCs; at least the half-width Latin alphanumerics appear to be exactly the same, so this version is almost identical to the "JP-24" font in the DOS/V section. Almost, but not quite: the PS/55's display adapter $[\rightarrow]$ padded the characters $[\rightarrow]$ to $13 \times 29$, so this font follows suit.

8514/A, XGA, XGA-2, IMAGE ADAPTER/A - ADAPTER INTERFACE DRIVERS:

These are a bit of an exception here, since they're not really hardware fonts. IBM's more advanced PC video standards had, among other things, hardware-accelerated text output for their highresolution graphics modes. These were accessed with an API called simply the Adapter Interface ("AI"), and the AI drivers for DOS contained some fonts for this purpose. (There's also an $8 \times 14$ size, but it basically copies the EGA/VGA font.)
True text modes remained purely a VGA function, although XGA(-2) had integrated the VGA part into the chipset, so they still used the same fonts as VGA.

These are NOT what most would call＂the＂DOS fonts，since DOS normally uses the video hardware＇s character set（or ．CPI versions that strongly resemble it）．Still，a number of DOS versions provided different fonts for specific purposes．

ISO－COMPLIANT IBM PC－DOS FONTS：
Starting with IBM PC－DOS 5．02（and later in MS－DOS as well），the＂ISO．CPI＂file included a bunch of new $8 \times 16$ codepage fonts．These were intended to comply with the（then－new）ISO standard for display ergonomics，namely ISO 9241－3：1992，＂Ergonomics－Office Work with Visual Display Terminals（VDTs）－ Visual Display Requirements＂，which went into extreme detail regarding character height，stroke width，size uniformity，spacing，and so on so forth．

DOS／V－JAPANESE VERSIONS OF IBM（PC－）DOS／MS－DOS：
Technically these aren＇t hardware／text mode fonts，so they＇re another exception here．DOS／V（V for VGA，not 5．0）ran in permanent graphics mode to support Japanese full－width glyphs and double－byte charsets，so you could choose from a whole heap of resolutions［ $\rightarrow$ ］（all with a square pixel ratio） and character cell sizes．

However，the following versions do＊not＊include the Japanese scripts．They＇re REMAPPED／REMADE for codepage 437／US，so they preserve only the half－width Latin alphanumerics，with custom additions to fill out the rest．

These originate from the various IBM versions of PC－DOS／V．The $8 \times 19$ and $12 \times 30$ fonts mostly duplicate their smaller siblings，with more generous vertical padding．For the 24／30－pixel versions，cf．IBM PS／55：

Microsoft came in a bit later in the game; MS-DOS/V used a similar system, through it redesigned (and renamed) the font files:

## CHINESE PC-DOS VERSIONS (TAIWAN \& PRC):

These were technically DOS/V as well, and the ASCII portion of the 24/30-pixel fonts is identical to the Japanese version, so these larger charsets are not repeated here.

In Taiwan, the Latin fonts unique to PC-DOS T7.0/V do have native CP437 encoding, so no remapping was needed. In fact they look like they're probably derived from OS/2:

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| DOS/V TWN16 $8 \times 16$ : <br> 8x16; CP437 | Square <br> 1:1 | DOS/V TWN16 ■ AaBbCcDd 0123456789 |
| DOS/V TWN19 8x19; CP437 | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | DOS/V TWN19 - AaBbCcDd 0123456789 |

The fonts from the PRC version are once again REMAPPED, and slightly adjusted for legibility to boot. Interestingly, they look quite close to those used on the Japanese IBM JX[ $\rightarrow$ ] (still mising from this collection).

The deluge of IBM PC compatibles included some outliers that extended on IBM's video standards, although most of them didn't. A lot of the clone makers contented themselves with cloning IBM's character bitmaps, too. These are naturally absent from this collection - only those with their own font designs are included here.

ACER INC. / MULTITECH ELECTRONICS

ACER 710:

Acer's 'Turbo XT' machine from $\sim 1987$ includes an on-board video controller for CGA, MDA, and Hercules compatibility. The Acer folks went through the trouble of modifying IBM's glyph designs, albeit not very daringly. A bit more obvious in the monochrome font, where they toned down the serifs a little like ATI did.

This CGA font was also seen earlier in some Multitech cards from the mid-1980, before the rebranding to Acer, e.g. the CGA-PC PB85048-3A (but not all of them; the Multitech MPF-PC CGA for one pretty much ripped the IBM font).

## AMSTRAD CONSUMER ELECTRONICS

AMSTRAD PC1512 / PC1640 / PPC:

These computers all feature a nicely readable $8 x 8$ font with a consistent style; very small differences exist between models. Characters are wider and more tightly spaced than in IBM's fonts. Besides the default codepage 437, Danish and Greek fonts were available, and the PC1640/PPC models added Portuguese; I used these as a basis for the 'Plus' unicode version. The PPC line adds built-in monochrome support, along with the $9 \times 14$ font that this entails, but it's nearly identical to that of the IBM MDA.

| Font/Charsets: | Aspect: | Sample text: |

AST PREMIUM EXEC:

This laptop came with a $3: 4,640 \times 480$ VGA LCD. At only 400 scanlines, normal $8 \times 16$ VGA text would appear squashed, so the display could be set to "Expand mode", which enables $8 \times 19$ characters for a square-pixel $80 \times 25$ text mode. AST's version of DOS 5.0 includes 19 -scanline fonts for multiple codepages, which I've combined into the 'Plus' version here.

## ATGT INFORMATION SYSTEMS

## AT\&T PC6300:

The rebadged Olivetti M24, with its enhanced CGA-compatible video, introduced 400-line text and graphics modes for increased resolution. These supported an $\mathbf{8 x 1 6}$ character set, which was similar to the IBM MDA font, but with more of a slab serif style on the uppercase letters, and more consistent metrics for the lowercase and accented Latin characters.
This is the text mode version - in the $640 \times 400$ graphics mode, the only difference is a more rounded 'h' (identical to the IBM MDA one). The $8 \times 8$ BIOS font, on the other hand, was exactly the same as IBM's.

## COMPAQ COMPUTER CORP.

## COMPAQ PORTABLE III, PORTABLE 386:

In terms of video these two portables are identical: both are CGA-compatible, but add an extended $640 \times 400$ resolution and allow redefinable characters. The default font is loaded from the BIOS, rather than a dedicated ROM. The orange plasma screen uses square pixels, so the $1: 1$ fonts here are already aspect-correct.

| Font/Charsets: | Aspect: | Sample text: |

Compaq's OEM versions of MS-DOS include their own lighter versions of the system font, loadable from a command-line utility. These versions come from Compaq-DOS v3.31; later versions introduced slight differences, but chiefly in the way of adding more of those weird little gaps in the glyphs. These fonts aren't specific to a video mode/resolution, so there's no "correct" pixel aspect as such.

## CORONA DATA SYSTEMS / CORDATA

CORDATA PPC-21:

Corona rode the initial wave of PC compatibles, and was praised for its high-quality text displays. This particular 'luggable' has $640 \times 325$ mono graphics, but in the $80-\mathrm{column}$ text mode, each character is 16 dots horizontally - twice the usual resolution. With the original CRT's 1:3 pixel aspect, the result is very well-defined.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| Cordata PPC-21 <br> 16x13; CP437, +Plus | Square <br> 1:2 | Cordata PPC-21 AaBbCcDd 0123456789 |
|  | Correct $1: 3$ | Cordata PPC-21 A ABbCcDd 0123456789 |

CORDATA PPC-400:

This 1984 portable increased the text resolution even further: the monochrome CRT now handled 400 scanlines, and character cells were $16 \times 16$. At 80 columns, you effectively have a pixel resolution of $1280 x 400$ - much sharper than even VGA and later. Another very nice font which deserves a 'Plus' enhancement.

| Font/Charsets: | Aspect: | Sample text: |

DATA GENERAL CORP.

DATA GENERAL/ONE (FIRST MODEL):

Known from the minicomputer market, DG introduced in 1984 what was probably the first true PCcompatible laptop with a full-sized $4: 3$ LCD panel. Alas, the display panel was remembered mostly for its atrociously poor contrast, and perhaps that was the reason for the alternate font with its heavier weight. However, it's also possible that it was used as a substitute for high-intensity CGA
text, since the panel couldn't handle multiple shades of gray; to emulate such a behavior, these fonts have both regular and bold styles.

HEWLETT-PACKARD CO.

HP 100LX/200LX PALMTOP PCS:
HP's successful PDAs from the mid '90s were very much PC compatible, form factor notwithstanding, and came with MS-DOS and lots of other goodies in ROM. These models were 80186- and CGA-compatible, but the display system had a few more tricks up its sleeve such as zoomable text modes with different font sizes to match.

The built-in charsets were multilingual - Latin alphabets only, but the 'Plus' versions here include even more custom enhancements.

NEC HOME ELECTRONICS

## NEC MULTISPEED:

NEC's 1986 answer to IBM's PC Convertible was a laptop based on its own 10 MHz V30 CPU, 8086compatible but more advanced. The supertwist LCD display provides a CGA-compatible 640x200 resolution with 8 gray levels. In text mode, a thin-stroke font represents normal intensity, and a bolder version is used for high intensity (there's also a DIP switch to reverse that assignment).

SANYO BUSINESS SYSTEMS

SANYO MBC-550/555:
3.58-MHz 8088 computers in a "pizza-box" form factor (likely a repurposed Sanyo VCR chassis). They were introduced in 1983 as the cheapest PC clones of their time, although for a number of reasons they weren't all that IBM-compatible - they should really be in the "semi-compatibles" section, but I've kept them here next to their younger MBC brothers.

The display hardware is better than CGA, with 8 colors at $640 \times 200$, but its $8 \times 8$ font still sticks pretty closely to IBM's (with only subtle differences, as in the slashes) so it's here mostly for completeness' sake.

SANYO MBC-775/885:

The 775 was much more of a true compatible, and perhaps the first portable PC clone (really a "luggable") to come with a color RGB CRT; The 885 was the hard-drive version. The built-in video appears to be true CGA this time, but they go a bit more out there with the character design here: see that weird serpentine 'S', stroked 'Z', curvy 'l' (not to mention foreign objects like the 'Ç'/'æ').

|  | $\begin{aligned} & \text { Correct } \\ & 5: 12 \end{aligned}$ | SanyoMBC775-2y |

SANYO MBC-16:

I do not have much information about this computer, beyond the fact that it has CGA (and perhaps mono?) capabilities. As a matter of fact, I need a better source for the font (s) - the upper/nonASCII half here can be considered a placeholder. If you own one, please get in touch; the same $8 \times 8$ font also appears to be used on the MBC-670, and perhaps others.

SCHNEIDER EUROPC/EUROPC II:

After partnering with Amstrad to sell the 8-bit CPC in the German-speaking market, Schneider came up with PC/XT clones using the same "computer-in-a-keyboard" form factor. Both include an on-board video chip which handles CGA and Hercules graphics, and provide fonts in the expected formats, although they're not all that different from IBM's CGA and MDA fonts respectively:

| Font/Charsets: | Aspect: | Sample text: |

SEEQUA COMPUTER CORP.

SEEQUA CHAMELEON:

Although this is an interesting dual-CPU (Z80+i8088) luggable, the PC-compatible half of its split personality is compatible enough to be included in this category. Text and graphics output are CGAtype, and the $8 \times 8$ font doesn't try very hard to distinguish itself from IBM's original.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |

SHARP PC-3000:

Designed by DIP Research like the earlier Atari Portfolio, this 80C88-based palmtop computer is more of an actual PC compatible. Its square-pixel $640 \times 200$ monochrome LCD panel displays CGA graphics (aspect ratio issues aside), with some adjustment options, like inverting the screen colors for a CRT-like white on black, and swapping the default $\mathbf{8 x 8}$ font for a lighter one using a hotkey.

## SPERRY CORP.

SPERRY PC (HT3070-03):
The Sperry PC was basically the original Leading Edge PC (latter designated the "Model M") sold concurrently by a different vendor, but Sperry souped up their version a little. Most interestingly, there was an optional adapter/monitor combo that pulled off such tricks as 256 colors at $320 \times 200$, and hi-res $640 \times 400$ video (using $8 \times 16$-dot characters) with 16-color text/graphics overlay: not bad at all for 1984! Both the CGA and hi-res fonts are reproduced here.

## TANDY CORP.

TANDY VIDEO I - EARLY TANDY 1000 SERIES (1000, A, HD, EX, SX, TX, HX):

One peculiarity of the 1000 series is the 225 -scanline text mode, using an $8 x 9$ character cell to improve readability. All but the earliest models (pre-EX) boot into this mode by default, so the $8 x 9$ variant is more commonly seen in text mode. You can still set "TV mode" for standard 200-line text, and graphics modes are always 200 pixels tall in any case, so the $8 \times 8$ size is still around.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |

TANDY VIDEO II - LATER TANDY 1000 SERIES (SL, SL/2, TL, TL/2, TL/3, RL):

By this point, MS-DOS 3.x was included in the system ROM; but the Tandy Video II chip still couldn't redefine fonts for code-page support, so two character sets from MS-DOS were built in: CP437 (US) and CP850 (Western European Latin). As they're identical to the DOS . CPI fonts, the expanded 'Plus' version here is based on the latter.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| Tandy1K-II 200L 8x8; CP437, +Plus | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 6 \end{aligned}$ | Tandy1k-I 209L AaBhcoDd 1234567 |
| $\begin{aligned} & \text { Tandy1K-II 200L-2x } \\ & 8 \times 8 ;{ }_{\text {CP437, }}^{+ \text {Plus }} \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 2: 1 \end{aligned}$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 3 \end{aligned}$ |  |
| $\begin{aligned} & \text { Tandy1K-II 200L-2y } \\ & \text { 8x8; CP437, +Plus } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 2 \end{aligned}$ | Tandy1K-II 200L-2y 1 AaBbCcDd 0123456789 |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 12 \end{aligned}$ | Tandy1k-II 200L-2y i AaBbCcDd 0123456789 |
| Tandy1K-II 225L <br> 8x9; CP437, +Plus | Square <br> 1:1 | Tandy |
| Tandy1K-II 225L-2y 8x9; CP437, +Plus | $\begin{aligned} & \text { Square } \\ & 1: 2 \end{aligned}$ | Tandy1K-II 225L-2y 1 AaBbCcDd 0123456789 |

The Video II chip could also drive a monochrome monitor (for MDA/Hercules modes), hence the additional $9 \times 14$ font. This one was cribbed from MS-DOS as well, so it lacks the wider 'M'/'T'/'W'/etc., which usually show up in hardware 9-dot fonts.

| Font/Charsets: | Aspect: | Sample text: |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

TELEVIDEO TS-1605/TS-1605H (TELE-PC/TELE-XT):
Two 1984 machines, pretty much identical except for the 'H' model having a hard drive. Not all that
special in terms of capabilities, but the VLSI chipset allowed most functions to reside on board,
and the design was based on TeleVideo's own terminals, complete with a swivel-mounted 14 " monitor
(green monochrome, but CGA-capable).
Coming from terminals, TeleVideo put in the effort to improve legibility by making the character
cells taller ( $8 \times 9)$, so there's actually some spacing between rows of text. The default font is
still clearly based on IBM's thin CGA font; a jumper changes this to a heavier double-dot one (not
yet extracted for this collection).

| Font/Charsets: | Aspect: | Sample text: |

## TOSHIBA CORP.

TOSHIBA SATELLITE SERIES:

The earlier Satellite laptops were released when text mode was still a relevant use-case, and their built-in VGA fonts share a consistent sans-serif design which is quite distinctive and readable. Optionally, the text display could be stretched to fill the $4: 3$ screen, so the aspect-corrected versions conform to the expected VGA pixel aspects.

This version of the font comes from the Satellite 4200 ; some other models introduced a few (negligible) differences.

TOSHIBA T-SERIES:

This doesn't apply to the original T1x00 laptops, which used duplicates of IBM's fonts, but to later models starting somewhere around 1986's T3100. They came with either amber plasma displays or LCD panels, and allowed the selection of single-dot or double-dot fonts - both of which had a custommade stylized design.

The aspect-corrected variants are based on the gas-plasma models (e.g. T3100, T3200, T5100) which sported $640 \times 400$ pixels on their $4: 3$ screens.

## MISCELLANEOUS CLONES - BIOS/OEM FONTS

These all replace the $8 \times 8$ PC BIOS font in their respective machines, so they only ever show up in graphics mode, and include just the lower 128 ASCII characters. The other 128 were added manually to complete the CP437 character set, with varying amounts of effort to keep the design consistent (and most of these didn't merit much effort).

AMERICAN MEGATRENDS (AMI) BIOS:

See the $8 \times 8$ AMI EGA font, which is identical to what AMI used in its system BIOS firmware.

COPAM ELECTRONICS BIOS:
A prolific PC clone manufacturer from Taiwan. At least for version 3.86 of their generic XT-class BIOS (1985), the author seemingly grabbed a copy of the standard CGA font and proceeded to add/remove pixels pretty much at random. The result is about as hideous as you'd expect.

| Font/Charsets: | Aspect: | Sample text: |

|  | Correct $5: 12$ | DIK BI0S-2y ı ABPbCcDd 0123456789 |

PHOENIX TECHNOLOGIES BIOS (V2.X):

Phoenix's brand of BIOSes (at least two known revisions: v2.27, v2.51) used an interesting graphics mode font with a bit of an Amiga style to it, although the capitals and numerals also resemble the classic Atari/Namco arcade font somewhat. As a result of the Phoenix BIOS line's success, this font can be found on quite a number of machines -- from generic beige boxes to Commodore's PC-compatible range (Commodore PC-I/II/III/Colt).

| Font/Charsets: | Aspect: | pe t |

ATI WONDER (AND LATER) VIDEO CARDS:

> This series of fonts includes every standard cell size supported by the usual CGA/EGA/VGA modes, and is used on a very wide range of ATI cards: most of the EGA/VGA Wonder, Mach $32 / 64$, Rage, and similar lines. The style is maintained across sizes, and the $9-$-column variants have their own alternate wide glyphs ('M', 'T'and co.) to replace their 8 -column counterparts.

CIRRUS LOGIC INC.

CL-GD510/520 ('EAGLE II') VGA:
This 1988 Super VGA chipset offered a few extended video modes, true register-level backward compatibility with EGA/CGA/MDA/HGC, and the ability to drive the pre-VGA digital monitors required by those earlier standards. But this impressive level of fidelity didn't extend to VGA text mode appearance - the 8/9x16 fonts got quite the overhaul.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { CL EagleII } 8 \times 16 \\ & 8 \times 16 ; \text { CP4 }^{2} \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | CL EagleII 8x16 A AbCcld 0123456789 |

|  | Correct 3:4 | CL EagleII 9x16 • AaBbCcDd 0123456789 |

CL-GD5320 ('EAGLE III') VGA:
A later (1990) revision of the Eagle II, which simplifies integration by requiring less external circuitry, and adds some more modes and features along the way. The 'III' designation only seems to show up in a support utility or two, but it makes for a catchier font name than "CL-GD5320".

Again, only the $\mathbf{8 x 1 6 / 9 x 1 6}$ font designs are unique to this model. They're styled like those of its older brother the II, just with the glyph heights toned back down a notch.

## CL-GD610/620 ('STINGRAY') MOBILE VGA:

No relation to Hercules' Stingray 3dfx boards. This 1989 SVGA controller was specialized for flatpanel output, so it cropped up in a variety of portable machines from the likes of GRiD Systems, Olivetti, and others. For industry-standard 25 -row text on $640 x 480$ square-pixel displays, there's a
new $\mathbf{8 x 1 9}$ font size; and as flat panels were often monochrome at the time, the $x \mathbf{1 6} / x 19$ sizes also get bold versions, which stand in for high-intensity text.

CRTs are supported too, but the fonts used in that case are identical to the Eagle II.

EAGLE COMPUTER

EAGLE SPIRIT CGA BOARD (ALTERNATE FONTS):

Eagle Computer produced a number of early PC compatibles; the Spirit was a 1983 lug̣gable with a built-in 9" CRT. This CGA board was released for that specific machine, although it's (probably) usable with any IBM or clone. The default font is yet another identical copy of IBM's CGA charset, but interestingly the character ROM contains 3 more alternate fonts.

The first one ('Alt1') is identical to the system font from Eagle's 1630 and PC-2 computers, if not others. The other two are sci-fi \& fantasy-inspired fonts: clearly not meant for "serious" use, but pretty elaborate and well-done regardless.

EPSON MGA Q205A:
The Q205A is a "Multi-mode Graphics Adapter" - the 'M' doesn't just stand for monochrome, as this board could be toggled for either CGA or Hercules compatibility. As such, it was provided with $8 \times 8$ and $9 \times 14$ ROM fonts to match, and even went the extra mile of including an alternate single-dot CGA font.

This board was often sold with the earlier Epson Equity-series computers, and the same fonts were used for the Equity LT laptop.

EVEREX SYSTEMS

## EVEREX MICRO ENHANCER:

The Micro Enhancer series was a line of so-called "super EGA" boards with various extended feature sets. The ME Deluxe EV-657 supported (among other things) some proprietary text modes in a rare example of odd character widths, e.g. $132 \times 44$ characters at $5 \times 8$ dots each, and $94 \times 51$ at $7 x 8$.

The EV-659A was a similar board, which supported resolutions such as $640 \times 480$ (although it wasn't VGA-compatible). It is assumed that this explains the $\mathbf{8 x 1 6}$ VBIOS font.

## PARADISE SYSTEMS

PARADISE VGA PLUS:
This SVGA board had its own set of extended modes, and the DOS drivers included a set of fonts for them. At least on non-multisync monitors, they were rendered as 7 rather than 8 dots wide: $132 \times 43$ characters at $7 \times 9$ pixels each, and $132 \times 25$ at the $7 \times 16$ size. These are clearly thin-stroke versions of the original IBM bitmap fonts.

PHOENIX TECHNOLOGIES

VIDEO CARDS W/PHOENIX EGA BIOS:

Phoenix's EGA firmware has these character sets built in. They all follow a consistent design with less rounded curves, sharper diagonals, and thinner strokes on the more elaborate characters. All the usual character sizes for EGA text modes make an appearance, complete with the monochromefriendly $9 x 14$ size.

Some of these cards were based on C\&T's 82 C 435 controller, and unlike standard EGA it also supported a 400 -line text mode; so there's an $8 x 16$ variant (with an unusually small $x$-height), but no VGAcompliant $8 \times 16$. The $8 \times 8$ size can also be seen in machines based on the Phoenix *system* BIOS v3.x, as the default for CGA graphics.

## SIGMA DESIGNS INC．

REALMAGIC GX／64：

The entire point of the RealMagic series was its hardware MPEG video decoding，so it may come as a surprise that this card＇s VGA BIOS bothers with a triviality like the appearance of text modes． Actually，this is a close relative of the Rendition Verite font set（and others from the same general Phoenix VBIOS lineage），with a few minor adjustments，and this time we do get alternate wider glyphs in the 9x14／9x16 versions．

STB SYSTEMS

STB AUTOEGA:

STB had a few models with this designation, based on C\&T's 82C435 EGA chipset, and at least some of them could be populated with extra RAM chips *and* clock crystals to support higher resolutions. The ROM for this one copies IBM's $8 \times 8$ font, but the $\mathbf{8 x 1 4} / \mathbf{9 x 1 4}$ sizes do their own thing with the design.

## TRIDENT MICROSYSTEMS

## EARLY TRIDENT TVGA (8800CS):

The very first (S)VGA chipsets from Trident came with matching firmware, which customized the font styles as well. All standard VGA text sizes got a similar treatment, in a kind of rough-looking sans serif type:

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { TridentEarly 8x8 } \\ & \text { 8x8; CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ |  |
|  | Correct $5: 6$ | TridentEarly 8r8 ¢ AabbucDd 01234 |
| $\begin{aligned} & \text { TridentEarly 9x8 } \\ & 9 \times 8 \text {; CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ |  |
|  | Correct $3: 4$ | TridentEarly 9x8 AaBbCoDd 01234 |
| $\begin{aligned} & \text { TridentEarly } 8 \times 14 \\ & \text { 8x14; CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | TridentEarly Bx14 A Bbicdd 0123456789 |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 6 \end{aligned}$ | TridentEarly Bx14 © AaBbCcDd 0123456789 |
| $\begin{aligned} & \text { TridentEarly } 9 \times 14 \\ & \text { 9x14; CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | TridentEarly 9xi4 AaBbCeDd Di23456 |
|  | Correct $3: 4$ | TridentEarly 9x 14 - AaBbCcDd 0123456789 |
| $\begin{aligned} & \text { TridentEarly } 8 \times 16 \\ & 8 \times 16 ; \text { CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | TridentEarly Bxi6 AaBhCeDd 0123456789 |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 6 \end{aligned}$ | TridentEarly 8x16 M AabbCcId 0123456789 |
| $\begin{aligned} & \text { TridentEarly 9x16 } \\ & 9 \times 16 ; ~ C P 437 \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | TridentEarly 9xi6 AaBbCcDd 0123456 |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 4 \end{aligned}$ | TridentEarly 9x16 MaBbCcDd 0123456789 |

There were also some proprietary TVGA text modes that called for an $8 \times 11$-dot cell. The $1: 1$ aspect is as seen in proprietary mode 51 h ( $640 \times 480$ ), but mode 55 h ( $1056 \times 480$ ) had a roughly $3: 5$ pixel aspect.
This one looks much rougher than the others; I'd say it crosses over firmly into "ugly", but thankfully it didn't see a lot of use.

LATER TRIDENT TVGA SERIES:

Trident's inexpensive video solutions didn't go out of their way to distinguish themselves in terms of speed and performance. Fittingly, later TVGA-based cards make their text characters less distinctive as well, sticking very closely to IBM's VGA and co. with only some token modifications here and there.

The aforementioned $8 \times 11$ size was also changed. Different firmware used different fonts for that one; this one is taken from an Octek TVGA8900B card (with an additional fix in some of the accented characters, to make the baselines consistent).

TSENG LABS

TSENG LABS EVA-480 (ET2000):

The ET2000 was Tseng Labs' first real integrated chipset, and featured a superset of EGA capabilities. The EVA-480 board could pull off extended resolutions like $640 \times 480$, and had a special daughterboard(!) for $100 \%$ CGA/HGC support.

On top of that, the firmware included a couple of condensed fonts ( $\mathbf{6 x 8}$ and $\mathbf{6 x 1 4}$ ) for 132 -column text modes. These only worked on multisync monitors - in fact, this board was rebranded as the NEC MultiSync Graphics Card BG-I and marketed for use with NEC's original MultiSync.

WYSE WY-700:

Originally a terminal manufacturer, Wyse was noted for its hi-res text displays. The WY-700 was one of the high-end graphics solutions that appeared for the emerging GUI, desktop publishing and CAD markets in the mid-'80s, before VGA, SVGA or VESA were a thing. It could emulate standard CGA/monochrome on its specialized $1280 \times 800$ "paper-white" monitor, so it featured a large $16 \times 16$ character set, for either $80 x 25$ or $80 \times 50$ text mode.

This came in two hardware charsets: a thick serif font, which can pass as a higher-resolution version of the IBM MDA font, and a thin sans-serif one which is probably less of an eye-strain at $80 \times 50$.

## MISCELLANEOUS VIDEO FIRMWARE FONTS

VARIOUS (WANG, CHROMATIC RESEARCH, NEOMAGIC, SILICON MOTION):
Some video hardware manufacturers were pretty promiscuous with their charset designs, so tracing their origins can get touchy. This font, for instance, first(?) cropped up in a Wang Laboratories VGA card circa 1991 (the 3050 / WVGA-16HR), but derivative variants show up in the VGA BIOS of seemingly unrelated products, e.g. desktop and mobile chips from the mid-late '90s: Chromatic Research's Mpact2, NeoMagic's 2160 and 128XD, and Silicon Motion's SM910.

This version is a bit more polished than Wang's, and comes from the Mpact2 firmware, where the bitmap data has this string appended: "VGA FONT' 1.05 .02 02/16/93 ACM". So for naming purposes, I'll go with that.

These computers generally ran some kind of x86 CPU, and their own customized versions of MS-DOS, but only had limited degrees of IBM PC compatibility. That puts these fonts less firmly within the project's scope, but it's not as if they're collected anywhere else, plus some of these machines were more interesting than a vanilla PC clone, so let's bring 'em on.

## ACORN COMPUTERS

BBC MASTER 512:

What's an Acorn machine doing in a PC-focused collection, you ask? Well: this 8-bit computer came with an 80186 board that functioned as a PC-compatible extension running Digital Research's DOS Plus (and GEM). Compatibility was far from 100\%, due to architectural limitations; that included its CGA emulation, which had some color and speed constraints, and letterboxed the 200 CGA scanlines within the 256-line screen.

The built-in $\mathbf{8 x 8}$ font is similar to the usual BBC Micro one, but with the DOS code page 437 charset. The hardware couldn't do 16 colors in text modes, so high-intensity text was made bold instead:

There was also what DOS Plus called "Mode 7" (actually Mode 3 in Beeb terms); this was faster, and filled the screen vertically, at the cost of introducing 2 lines of space between each row of text.

## ACT / APRICOT COMPUTERS

APRICOT LINE (PC, XI, F1, F2, XEN):
The desktop Apricots all supported a hi-res $800 \times 400$ monochrome monitor, giving $80 \times 25$ characters at 10x16 pixels each. Models with the color option added lower resolution fonts: 8x8 on 200-line displays, and $8 \times 10$ on 256 -line ones (which made the pixels almost-square at $320 \times 256$, or $16: 15$ to be exact).

The 286-based Xen was more of a PC-AT competitor, and it retained the hi-res mono option, but the color modes were brought closer to EGA at $640 \times 350$, and the corresponding font was accordingly $8 \times 14$ dots in size.

APRICOT PORTABLE:

The portable version was somewhat different in that it didn't have a true text mode - it permanently ran in $640 x 200$ graphics mode, and as every pixel was addressable, the text could be customized with loadable soft fonts. It was mostly seen with Apricot's default 200-line font (above), but at least one version of the system disk swapped it for this one:

ATARI CORP.

## ATARI PORTFOLIO:

This was the world's first true palmtop, originally released in the UK by DIP Research but then licensed to Atari. Its 8088 CPU ran a customized DOS from ROM, and its monochrome LCD panel (no backlight) could pull off $240 \times 64$-pixel graphics, or $40 \times 8$ text characters of $6 \times 8$ pixels each.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { Portfolio } 6 \times 8 \\ & 6 \times 8 ; \text { CP437 } \end{aligned}$ | Square 1:1 |  |

DEC RAINBOW 100:

The video system on this dual-CPU computer (Z80+8088, for running both CP/M and MS-DOS) was related to Digital's VT100/VT220 terminals, and could display text in four different column widths. 40/80column text uses 10 -dot-wide character cells, and $66 / 132$-column text shaves off one dot of spacing. Like the terminals, each pixel is doubled horizontally so that one bitmap dot becomes two on the screen (although the effect on double-width text isn't the same as on the terminals $[\rightarrow]$ ).

The Rainbow's character set $[\rightarrow]$ is also based on the DEC standard, not on the IBM PC one. This means that the CP437 version here is a custom adaptation, but all of the original characters (and more) are still available in the 'Plus' fonts.

FUJITSU

FUJITSU FM-TOWNS SERIES:
A successful line in Japan with quite a few models. Display options varied, but most modes had square-pixel resolutions, so no aspect correction should be needed for the fonts. The FM-Towns didn't have a full CP437 encoding, so rather than $100 \%$ faithful conversions, the versions here are ADAPTED/REMAPPED; they only cover the half-width character forms.

## HEWLETT-PACKARD CO.

HP 150 TOUCHSCREEN:

HP's first MS-DOS PC, from 1983, was an $8-M h z 8088$ office machine touting an IR touch system for its monochrome CRT. Its $80-$ column text was especially sharp; there are $9 \times 14$ dots per character, but each scanline may be shifted by half a dot, which effectively doubles the horizontal resolution. The attention to detail didn't stop there: each dot is also stretched wider by $\sim 1 / 3[\rightarrow]$, making
vertical and horizontal strokes equally wide despite the pixel aspect ratio. (Bitmap font formats can't emulate that very well, so only the outline fonts replicate this dot-stretching here.)

The 150 can use several character sets[ $\rightarrow$ ] simultaneously, but none of them match up with the IBM PC's; so once again the CP437 version here has been remapped for that code page, but the 'Plus' version has a much more complete selection.

MINDSET COMPUTER CORP.

MINDSET :

This innovative but short-lived 1984 machine offloaded quite a few tasks to custom chipsets, Amigastyle. These coprocessors also handled advanced graphics at 320 or 640 pixels across, and 200 (or 400 interlaced) lines vertically. "Text mode" was emulated in graphics, so it supported custom character sizes and designs - even proportional fonts, but the system font was a monospaced $8 \times 8$.

## NEC INFORMATION SYSTEMS

NEC APC III:

NEC's 8086-based model from '84 was praised for being technically superior to contemporary PCs, and the display was no exception, with low (320x200), medium (640x200) or hi-res (640x400) output in either mono or color, and separate text/graphics buffers.

The APC III is closely related to the PC-9800 series marketed by NEC in Japan, and its fonts appear to be CP437 adaptations of that platform's native character sets.

## PHILIPS INFORMATION SYSTEMS

## PHILIPS :YES:

The :YES was an 80186 machine with proprietary on-board video allowing 160/320/640x252 graphics. Consequently, characters are $8 x 10$ pixels each for a total of 25 text rows, at an almost-square pixel aspect ratio. The 40/80-column text mode font ('T') is slightly different from the one used in graphic mode ('G').

There was an optional add-on for hi-res mono support (probably with a matching font), but that's MIA as of this writing.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { Philips:YES G } \\ & \text { 8x10; CP437 } \end{aligned}$ | Square <br> 1:1 |  |

## RESEARCH MACHINES

## RM NIMBUS PC-186:

A semi-compatible mainly seen in the British educational market, with a graphics subsystem supporting $320 \times 250$ or $640 \times 250$ RGB output. For standard $40 \times 25 / 80 \times 25$ text mode, the PC-186 used an $\mathbf{8 x 1 0}$ character cell, like some of the other "incompatibles" in this section. The PC2 model was presumably similar.

## VEB ROBOTRON-ELEKTRONIK

## ROBOTRON A7100:

This tenuously PC-compatible machine from 1985 was manufactured in East Germany, and officially ran on a Soviet clone of the 8086 CPU , although most units apparently shipped with actual 8086 s imported 'unofficially'. Video (like most other components) was not PC-standard; the basic card provided $80 \times 25$ text on the $640 \times 400$ monochrome display, using $8 \times 16$-dot characters. A later model, the A7150, had better compatibility and better graphics, but used (pretty much) the same default font.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { Robotron A7100 } \\ & 8 \times 16 ; \text { CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | Robotron AT100 A ABEbCOD- 123456789 |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 6 \end{aligned}$ | Robotron A7100 i AaBbCidd 0123456789 |

## SIEMENS AG

## SIEMENS PC-D:

The PC-D was yet another 80186 machine that ran its own customized version of MS-DOS; video output was monochrome at a $640 \times 350$ resolution, with a character size of $8 \times 14$ pixels to match. The system font is a readable, thin-stroke type which sort of resembles classic engineering/technical drawing text.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { Siemens PC-D } \\ & 8 \times 14 ; ~ C P 437 \end{aligned}$ | Square $1: 1$ | Siemens PC-D AaBbCoDd 012345 P ¢ P 9 |
|  | $\begin{aligned} & \text { Correct } \\ & 3: 4 \end{aligned}$ | Siemens PC-0 A AbBbCcDd 0123456789 |

## TANDY CORP.

## TANDY 2000:

For a 1983 computer the 2000 was certainly powerful, and no slouch in terms of visuals either, with a hi-res display and various add-on options providing $640 \times 400$ graphics in color or monochrome. The character generator was based on RAM rather than the typical ROM, so custom fonts could be programmed. In text mode, this is the default $8 \times 16$ font loaded on boot:

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { Tandy2K } \\ & 8 \times 16 ; \text { CP437 } \end{aligned}$ | Square $1: 1$ | Tandy 2 K ¢ AbBCDed 0123456789 |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 6 \end{aligned}$ | Tandy 2 K , AaBbCeDd 0123456789 |
| $\begin{aligned} & \text { Tandy2K-2x } \\ & 8 \times 16 ; \text { CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 2: 1 \end{aligned}$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 3 \end{aligned}$ |  |

Graphics mode uses a slightly different font, contained in the BIOS ROM. As with IBM's BIOS
graphics modes, only the first 128 characters are covered, unless the software provides the rest;
this version fills out the code page by analogy with the text-mode font:

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { Tandy2K G } \\ & \text { 8x16; CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 6 \end{aligned}$ | Tandy $2<G$ a AaBbCoDd 0123456789 |
| Tandy2K G-2x 8x16; CP437 | $\begin{aligned} & \text { Square } \\ & 2: 1 \end{aligned}$ |  |
|  | $\begin{aligned} & \text { Correct } \\ & 5: 3 \end{aligned}$ |  |

Other than the $8 \times 16$ graphics-mode font, the 2000's BIOS also sets up an $8 \times 8$ one, which is normally unused. As per the manuals, it's exclusive to the "medium-resolution graphics option board", AKA the "TV/Joystick Option", for $320 \times 200$ graphics on a TV set. It's unclear whether this mythical card was ever released; but that's no reason to keep the font obscure, so here's a version with the nonASCII characters similarly fleshed out:

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| Tandy2K G-TV 8x8; CP437 | Square |  |
|  | Correct $5: 6$ |  |

## TELENOVA

## TELENOVA COMPIS / COMPIS II:

Another computer aimed at the educational market, this time the Scandinavian one, the Compis (AKA Scandis) natively ran CP/M-86 from ROM, but it also had its own port of MS-DOS - which supported the PC's CP437 character set seen here. (Graphically, it could pull off $640 \times 400$ and even a monochrome 1280x800 'ultra hi-res' mode.)

| Font/Charsets: | Aspect: | Sample text: |
| :--- | :--- | :--- |
| Compis | Square | Compis i ABBbCoDd 01234567B9 |
| $8 \times 16 ;$ CP437 | $1: 1$ | Correct |
|  | $5: 6$ | Compis I AaBbCoDd 0123456789 |

TEXAS INSTRUMENTS

TI PROFESSIONAL COMPUTER/PORTABLE PROFESSIONAL COMPUTER:

These were two more 8088-based MS-DOS PCs which traded IBM compatibility for enhanced features (the later 286-based 'Business Pro' model would be fully compatible). Video was 720x300 in either color or mono; notably, even the portable had a color version at that resolution - in 1984.

That made the $\mathbf{9 x 1 2}$ text nice and sharp, although the lowercase letters and the caps/numerals have completely different styles for some reason.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { TI Pro } \\ & \text { 9x12; CP437 } \end{aligned}$ | $\begin{aligned} & \text { Square } \\ & 1: 1 \end{aligned}$ | TI Pro - FabbCoDd 0123456789 |
|  | Correct 5:9 | TI Pro 1 AaBbCcDd 0123456789 |

TOSHIBA T300:
Toshiba's 1983 not-quite-compatible machine one-upped the PC in a few respects, among them a faster 6 MHz 8088 and a selection of improved graphics adapters, from 320/640x200 to a $640 \times 500$ option showing 16 colors from a palette of 256 . Text modes were all 25 rows, so those 500 scanlines make me unsure about the correct aspect for the $8 \times 16$ font.

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |

## WANG LABORATORIES

WANG PROFESSIONAL COMPUTER/ADVANCED PROFESSIONAL COMPUTER:
Synonymous at the time with word processing, Wang's foray into general-purpose computing spawned the 8086 PC and the 286 APC, whose IBM compatibility didn't extend to the hardware level. The popular option was monochrome, at an $800 \times 300$ resolution. The color option provided NTSC or analog RGB output at $320 / 640 \times 225$ pixels, yielding an $8 \times 9$ character cell and a nearly-square pixel aspect.

## ZENITH Z-100 SERIES:

These were introduced in 1982, with an S-100 bus sporting two CPUs - 8085 and 8088 . The video hardware could manage up to 8 colors at a standard resolution of $640 \times 225$, giving approximately a $1: 2$ pixel aspect ratio; for a conventional $80 \times 25$ text screen, that meant $8 x 9-d o t$ characters.
The default font has single-dot strokes, but there's a thicker alternative which is very similar to IBM's $8 \times 8$ BIOS font, despite the extra scanline:

| Font/Charsets: | Aspect: | Sample text: |
| :---: | :---: | :---: |
| ZenithZ100 | Square |  |
| 8x9; CP437 | 1:2 |  |
| $\begin{aligned} & \text { ZenithZ100 Alt } \\ & \text { 8x9; CP437 } \end{aligned}$ | Square $1: 2$ | Zenith 2 -108 Alt A ABhGodd 0123456789 |
